

Maxus MultiSearch

This clever web utility provides a means of searching several Inmagic textbases at one time using *WebPublisher PRO*, returning a summary showing the number of items found. The user can then choose whether or not to display the records found. Any number of textbases can be added to the search screen. The textbases can be a mixture of DB/Text and *Content Server* formats and even need not be on the same web site!

Records are displayed using *WebPublisher PRO* form designs created with the TextWorks form designer.

The utility is supplied ready to use with up to three of your specified textbases*. It can then be placed on your web or intranet site and customised to use your organisation's web look and feel.

Go to <http://www.maxus.net.au/msearch.asp> to see **Maxus MultiSearch** in action!

The display of checkboxes to select which textbases to search is optional and can be turned off by a simple change within the ASP file.

*For a small fee more textbases may be added to the utility.
